

PedsGuide App Offers New Modules

The innovative Children's Mercy Kansas City PedsGuide app is introducing new modules for Diabetes/DKA and BRUE to assist with clinical guidance and decision support. The new modules will be available in January.

Diabetes/DKA:

- DKA diagnosis and initial management recommendations
- Weight and age-based tools for IVF and insulin drip titration during DKA management
- Routine (non-DKA) diabetes management algorithms and insulin doses

BRUE:

- Transformed algorithm for Brief Resolved Unexplained Event assessment and treatment guidelines

PedsGuide is a multi-module pediatric clinical decision support tool intended for use only by professional health care providers and emergency personnel for informational and educational purposes.* The free app also includes modules for Resuscitation, Febrile Infant and Asthma.

Each module provides users with a step-by-step interactive clinical decision support process, including reference material and/or contextually relevant information based on evidence-based practice and expert opinion routinely used in clinical practice, to assist in management of various acute illnesses in children.

* While PedsGuide is a helpful tool, it is not intended to replace the independent judgment and evaluation of health care providers and emergency personnel. Health care providers and emergency personnel should not rely primarily on the tool to make a clinical diagnosis or treatment decision. Children's Mercy is not responsible for the correctness of any action you take based upon your use of PedsGuide.
